

Remediation Report: Saltillo

Municipality ID: mx-coahuila-salttillo

Risk score: 83

Risk level: critical

Generated at: 2026-01-01T00:00:00.000Z

Summary:

Saltillo currently has a critical risk level with risk score 83 based on 6 passive scan findings. The first technician focused on the following findings:

Priority actions:

Priority 1: Confirm the WordPress core and plugin patch level, then upgrade to the latest supported release. Evidence: wordpress 6.4; confidence 0.8; references CVE-2024-31210

Priority 2: Restrict administrative entry points with access controls, MFA, and monitoring where operationally possible. Evidence: /wp-login.php returned 200

Priority 3: Send X-Content-Type-Options: nosniff on HTML and static asset responses. Evidence: x-content-type-options was not present in the selected response headers.

Priority 4: Add a tested Content-Security-Policy that limits script, frame, and object sources. Evidence: content-security-policy was not present in the selected response headers.

Priority 5: Enable HSTS after confirming HTTPS is stable for the site and subdomains. Evidence: strict-transport-security was not present in the selected response headers.

Evidence and remediation:

HIGH: WordPress 6.4 requires patch review

Evidence: wordpress 6.4; confidence 0.8; references CVE-2024-31210

Remediation: Confirm the WordPress core and plugin patch level, then upgrade to the latest supported release.

MEDIUM: Public admin path is reachable

Evidence: /wp-login.php returned 200

Remediation: Restrict administrative entry points with access controls, MFA, and monitoring where operationally possible.

MEDIUM: Missing X-Content-Type-Options

Evidence: x-content-type-options was not present in the selected response headers.

Remediation: Send X-Content-Type-Options: nosniff on HTML and static asset responses.

MEDIUM: Missing Content Security Policy

Evidence: content-security-policy was not present in the selected response headers.

Remediation: Add a tested Content-Security-Policy that limits script, frame, and object sources.

MEDIUM: Missing HTTP Strict Transport Security

Evidence: strict-transport-security was not present in the selected response headers.

Remediation: Enable HSTS after confirming HTTPS is stable for the site and subdomains.

LOW: CMS fingerprint was detected

Evidence: wordpress 6.4; confidence 0.8; evidence generator:WordPress 6.4, marker:wordpress

Remediation: Keep CMS core, extensions, and themes patched, and remove unnecessary public version disclosure.
